The A-10C is an enhanced version of the famous A-10A that served as a major close air support aircraft for the U.S. Air Force, Air National Guard, and Reserves for almost 30 years. A-10C has been upgraded to meet 21st century standards, using systems such as Multi-Function Color Displays (MFCD), GPS-guided weapons, and data-link support. Retaining all the features of older A-10A, the A-10C has turned into a true precision strike fighter with the most modern navigation systems, precision attack weapons (Maverick, JDAM, WCMD, and laser-guided bombs), and an integrated countermeasures system.

The A-10C has participated in operations over Iraq and Afghanistan and proved to be a precise and effective weapon in the "War on Terrorism". Its advanced equipment has greatly reduced the number of "friendly fire" incidents - thanks largely to the Situational Awareness Datalink (SADL) and the ability to better identify targets with using the Litening II AT targeting pod.

The A-10C of course retains its ability to do what it was originally designed to do: kill tanks in a conventional force-on-force battlefield.

Despite the fact that many of the computer and weapon systems are new in the A-10C, most of the remaining systems are retained from the A-10A. Engines, fuel, electrical, hydraulic and emergency systems, communications, and lighting do not differ from those in the latest versions of A-10A/A-10A+. As with previous versions, the A-10C - very easy to fly and is a stable and survivable weapons platform.

Though once considered for replacement by the "Common Support Aircraft", this conception never went into production, and the Hawkeye will continue in its role as the Navy's primary AEW aircraft for years into the future in the E-2D version.

The latest version of the E-2, the E-2D Advanced Hawkeye, is currently under testing. The E-2D features an entirely new avionics suite, including the new APY-9 radar, radio suite, mission computer, integrated satellite communications capability, flight management system, improved turboprop engines, a new "glass cockpit", and the added capability for air-to-air refueling.

The APY-9 radar features an Active Electronically Scanned Array, which adds electronic scanning to the mechanical rotation of the radar in its radome. The E-2D will include provisions for either one of the pilots to act as a Tactical 4th Operator, who will have access to the full range of the mission's acquired data.

The E-2D's first flight occurred on 3 August 2007. The E-2D undergo Initial Operational Test and Evaluation in 2011.

Like its sibling, the commercial Boeing 707 jetliner, the KC-135 was derived from the Boeing 367-80 jet transport "proof of concept" demonstrator, which was commonly called the "Dash-80". As such the KC-135 is similar, but has a narrower fuselage and is shorter than the 707.

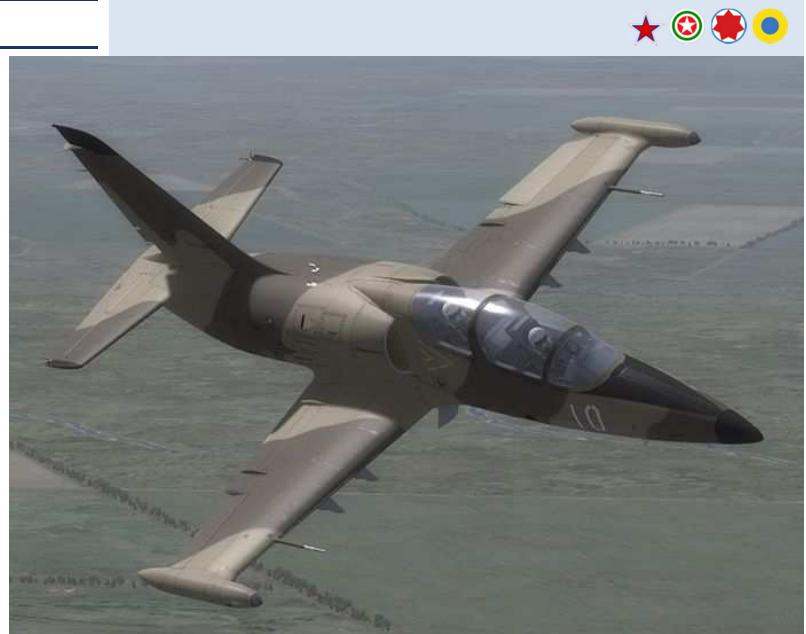

In the 1980s the first modification program re-engined 157 Air Force Reserve (AFRES) and Air National Guard (ANG) tankers with the Pratt & Whitney TF-33-PW-102 engines from 707 airliners retired in the late 1970s and early 1980s. The re-engined tanker, designated the KC-135E, was 14% more fuel efficient than the KC-135A and could offload 20% more fuel on long duration flights. (The difference is that the A-model weighed only 104,000 lb empty, while the E-model weighed 115,000 lb empty. But the maximum takeoff weight was not increased for the E-model. Therefore, the A-model could takeoff with 200,000 lb of fuel, while the E-model could only takeoff with 190,000 lb of fuel.) Only the KC-135E aircraft were equipped with thrust-reversers for takeoff aborts and shorter landing roll-outs. The KC-135E fleet has since either been re-engined into the R-model configuration or placed into long term storage ("XJ"), as Congress has prevented the Air Force from formally retiring them. The final KC-135E, tail number 56-3630, was delivered by the 101st Air Refueling Wing of the Maine ANG to the 309th Aerospace Maintenance and Regeneration Group (AMARG) at Davis-Monthan AFB in September 2009.

The KC-135 was initially purchased to support bombers of the Strategic Air Command, but by the late 1960s, in the Southeast Asia the KC-135 Stratotanker's ability as a force multiplier came to the fore. Midair refueling of F-105 and F-4 fighter-bombers as well as B-52 bombers brought far-flung bombing targets within reach, and allowed fighter missions to spend hours at the front, rather than just a few minutes, due to their limited fuel reserves. KC-135 crews refueled both Air Force and Navy / Marine Corps aircraft, though they would have to change to probe and drogue adapters depending upon the mission. Crews also helped to bring in damaged aircraft which could fly while being fed by fuel to a landing site. KC-135s continued their tactical support role in later conflicts such as Desert Storm and current aerial strategy.

2 x AGM-114 Hellfire (MQ-1)

The General Atomics MQ-1 Predator is an unmanned aerial vehicle (UAV) which the United States Air Force describes as a MALE (medium-altitude, long-endurance) UAV system. It can serve in a reconnaissance role and fire two AGM-114 Hellfire missiles.

The MQ-1 Predator is a system, not just an aircraft. The fully operational system consists of four air vehicles (with sensors), a ground control station (GCS), a Predator primary satellite link communication suite, and 55 people.

The Predator air vehicle and sensors are controlled from the ground station via a C-band line-of-sight data link or a Ku-band satellite data link for beyond-line-of-sight operations. During flight operations the crew in the ground control station is a pilot and two sensor operators. The aircraft is equipped with the AN/AAS-52 Multi-spectral Targeting System, a color nose camera (generally used by the pilot for flight control), a variable aperture day-TV camera, and a variable aperture infrared camera (for low light/night). Previously, Predators were equipped with a synthetic aperture radar for looking through smoke, clouds or haze, but lack of use validated its removal to reduce weight.

All Predators are equipped with a laser designator that allows the pilot to identify targets for other aircraft and even provide the laser-guidance for manned aircraft. This laser is also the designator for the AGM-114 Hellfire that are carried on the MQ-1.

The Yakovlev Yak-40 is a small, three-engined airliner that is often called the first regional jet transport aircraft. It was introduced in September 1968 with Aeroflot.

Built to replace the Ilyushin Il-12/14, its main design feature was ease of operation outside major airport service areas. It was equipped with a built-in airstair and capable of STOL operations. It also featured a unique S-duct central engine.

Since the demise of the old Aeroflot, many have been converted from passenger service layout to more luxurious corporate layouts and are in use as corporate and private aircraft.

Most of the Yak-40s in active service fly in the former Soviet Union and other countries.

The ship is armed with the Granit (Nato designation SS-N-19 Shipwreck) long-range anti-ship missile system. 20 Granit missiles are installed under the upper deck, mounted at a 60° elevation. The version of Granit on the Kirov is not controlled after launch. In ripple-fire mode, the lead missile follows a high flight trajectory, while the other missiles follow a low-level flight path. If the lead missile is intercepted then one of the other missiles automatically takes on the lead role.

An S-300F air defence missile complex is installed on the ship, with 12 launchers and 96 vertical-launch air defence missiles. The Osa-MA air defence missile system is supplied by the Znamya Truda Plant based at Saratov. The ship has two double launchers and 40 missiles. The system can operate autonomously or it can be integrated into the ship's combat systems and download target data from the ship's sensors. Osa-MA has a range of 1.2 to 10km at an altitude between 25m and 5,000m.

The ship is equipped with a Kashstan air-defence missile / gun system, supplied by the Instrument Design Bureau of Tula. The system provides defence against a range of precision weapons including anti-ship and anti-radar missiles and air bombs, aircraft, and small naval ships. Two command modules and six combat modules are installed on the ship. The command module provides autonomous operation by detecting the threats, distributing the threat data and designating the targets to the combat modules. The combat module automatically tracks the target with radar and television, calculates firing data and engages the target with missiles and guns.

The missile range is 8km and the gun range is 1.5km for altitudes up to 4,000m. The system can engage up to six targets simultaneously, one for each combat module. The guns can fire at a rate of 1,000 rounds a minute.

The Kirov is fitted with a 130mm AK-130 multipurpose twin-barrel gun supplied by the Ametist Design Bureau, Izumrud JSC and the Tula Engineering Plant. The main components of the artillery system are a computer-based control system with a multi-band radar, television and optical target sighting, and a gun mount with a turret-mounted Kondensor optical sighting unit.

The gun can be operated under fully automatic remote control interfaced to the radar control system, under autonomous control from the sighting unit or can be laid manually. Range is over 22km and maximum rate of fire is 35 rounds/min. The ship also has a 30mm AK-630 artillery system.

The ship has ten torpedo tubes for 20 Vodopad-NK anti-submarine missiles or torpedoes. The ship has two anti-submarine and anti-torpedo rocket systems, the Udav-1 with 40 anti-submarine rockets and the RBU-1000. The ship has two RBU-1000 six-tube launchers, with 102 rockets.

"Kirov is fitted with a 130mm AK-130 multipurpose twin-barrel gun."

The ship accommodates three Kamov Ka-27PL or Ka-25RT helicopters. The Kamov-27 (Nato codename Helix) is equipped for anti-submarine warfare with surface search radar, sonobuoys, dipping sonar, and magnetic anomaly detectors. The Ka-27 can be armed with torpedoes, bombs, mines and rockets. The Ka-25RT (Hormone) helicopter is the predecessor of the Ka-27.

The Leopard 1 is a tank designed and produced in Germany that first entered service in 1965. It was used as the main battle tank by over a dozen countries worldwide.

It is a fairly conventional tank, armed with a German-built version of the British L7 105-mm gun. The Leopard is known for its good cross-country speed.

Leopard 1A3

Tanks were fitted with a new welded turret incorporating spaced armor and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m³ and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.

PPRU-1M command post, equipped with the X-band acquisition radar. This 2D air search radar was developed from the "Scrum Half" guidance radar of the SA-15 "Gauntlet" SAM. It replaced the earlier "Whiff", "Fire Can", and "Fire Wheel" radars. Much more versatile than those systems, it is mounted atop a tracked carrier and can transition from travel to operating mode in three or four minutes. The vehicle also contains the Sborka comms system which allows it to give guidance to dispersed AA guns.

The system is designed to provide radar data to air defense forces command posts, army air defense units and air defense command and control centers of motorized rifle and tank divisions armed with the "Buk-M1-2" and "Tor-M1" SAM systems.

The radar is equipped with digital processing units for automatic and semi-automatic coordinate determination and non-cooperative target recognition (NCTR) capability. All of the system functions are highly automated by use of high-speed central processor units. The system utilizes advanced electronic counter-counter measures (ECCM) devices and techniques to maintain capability in a complex ECM environment.

The radar is installed on a tracked chassis offering high off-road capability. It is equipped with independent power generation equipment, navigation systems, radio datalink and communications systems. It is also equipped with an extensive Built-In-Test (BIT) system, as well as Training modes to enable realistic crew training. Automated set-up and recover equipment and functionality is used to prepare the system to and from combat readiness state.

The radar can be utilized in difficult climate conditions, transit on and off roads and transported by all standard transportation modes, including aircraft.

Length, m: 2.34

The CBU-97 is a 1,000-pound class weapon containing sensor-fused sub-munitions for specifically attacking armor. This Sensor Fused Weapon (SF) contains 10 BLU-108/B sub-munitions.

A BLU-108/B unit carries four independent Skeet anti-tank submunitions. After release from the dispenser, each BLU-108/B descends under a parachute to a pre-set altitude. Then a small rocket sends the BLU-108/B upwards and into a rapid spin, so that the Skeet warheads are released outwards. Each Skeet falls independently, scanning the ground with its IR sensor for the signature of a tank. When a target is detected, the Skeet detonates, firing an EFP (Explosively Formed Penetrator) directly downward, and a ring of fragments outwards (against soft targets in the vicinity). If no target is detected, the Skeet explodes immediately above the ground.

The Joint Direct Attack Munition (JDAM) is a guidance kit that converts unguided bombs, or "dumb bombs" into all-weather "smart" munitions. JDAM-equipped bombs are guided by an integrated inertial guidance system coupled to a Global Positioning System (GPS) receiver, giving them a published range of up to 15 nautical miles (28 km). The guidance system was developed by the United States Air Force and United States Navy, hence the "joint" in JDAM. The JDAM was meant to improve upon laser-guided bomb and imaging infrared technology, which can be hindered by bad ground and weather conditions. Laser designators are now being fitted to some JDAMs.

The GBU-31 is a standard Mk-84 general purpose bomb fitted with a JDAM guidance kit. The GBU-31 has the strakes along the sides of the bomb to improve flight characteristics.

The Joint Direct Attack Munition (JDAM) is a guidance kit that converts unguided bombs, or "dumb bombs" into all-weather "smart" munitions. JDAM-equipped bombs are guided by an integrated inertial guidance system coupled to a Global Positioning System (GPS) receiver, giving them a published range of up to 15 nautical miles (28 km). The guidance system was developed by the United States Air Force and United States Navy, hence the "joint" in JDAM. The JDAM was meant to improve upon laser-guided bomb and imaging infrared technology, which can be hindered by bad ground and weather conditions.

The GBU-38 is a standard Mk-82 general purpose bomb fitted with a GPS guidance kit. This kit, referred to as the Joint Directed Attack Munition (JDAM) kit, turns an ordinary Mk-82 into a precision guided munition with a significant stand-off glide range. The kit consists of the GPS antenna on the rear of the bomb, actuated tail surfaces to steer it, and strakes along the body of some JDAM versions (not so with the GBU-38). As long as the bomb can be provided adequate GPS signal, it can strike within 33 feet of inputted target coordinates day or night and in most any weather. This ability to strike targets through clouds and weather gives it a significant advantage of laser-guided bombs.

Illumination power: 1.6-1.8 million candela
Illumination durance, s: 240-300

Flares in pod: 8

The A-10C can drop illumination flares to illuminate a battlefield area for ground forces without benefit of night vision devices. After ejection, a programmable timer deploys a parachute and ignites the flare candle. In regards to the LUU-2, the flare burns magnesium and provides illumination over a 500 meter circular area when the flare is at 1,000 feet. The flare will burn for approximately 5 minutes.

This version of the Mk-82 adds the BSU-49/B high drag tail assembly, also called the "ballute". This allows the bomb to rapidly slow down after release. By slowing down, pilot can release such a retarded weapon at low altitude and not be caught in the blast effect of the weapon. Pilot can choose to release the Mk-82AIR in either retarded or "slick" (no ballute deployed) modes.

The AGM-65G is an improved "IIR Maverick" for the USAF. It is based on the AGM-65D, but uses the heavy warhead and fuze of the AGM-65E/F because it is especially designed for use against hardened tactical targets. The AGM-65G also has a new digital autopilot and improved tracking and target selection options. The new autopilot allows the operator to select a lower trajectory to prevent break of lock in clouds. The AGM-65G entered operational service with the USAF in 1989.

The 9M133 missile together with its 9P163-1 tripod launcher and 1PN79-1 thermal sight forms the 9K123 missile system, the 9K123 can be carried and operated by a two infantry crew. In addition to an infantry portable version the 9K133 the system has been integrated into a variety of other vehicles and weapons systems as either an upgrade package or new weapon system. The 9K133 has been fitted into a BMP-3 to form the 9P163M-1 tank destroyer and is similar in function to the Khrizantema missile system. The 9P163M-1 carries two 9M133 missiles on launch rails which are extended from a stowed position during transit. Missiles are re-loaded automatically by the tank destroyer from an internal magazine with 16 rounds (missiles are stored and transported in sealed canisters). NBC protection is provided for the two crew (gunner and driver) of each 9P163M-1 in addition to full armor protection equivalent to the standard BMP-3 chassis. The guidance system of the 9P163M-1 allows two missiles to be fired at once, the missiles operating on different guidance (laser) channels.

During the 2003 invasion of Iraq, Kornets were rumored to have been used by Iraqi forces to attack American M1 Abrams tanks.

According to GlobalSecurity.org, at least two M1 Abrams tanks and one M2 Bradley infantry fighting vehicle were disabled by Kornets.

The first verified episode of Kornet ATGM in combat use occurred during the 2006 Lebanon War, where the missiles, reportedly supplied by Syria, were successfully used by Hezbollah fighters to destroy and damage Israeli Merkava tanks. One of the first detailed accounts of IDF's successful capture of Kornet ATGMs on Hezbollah positions in the village of Ghadouriyeh appeared in the Daily Telegraph article, which also reported that the boxes were marked with "Customer: Ministry of Defense of Syria. Supplier: KBP, Tula, Russia." Several months after the cease-fire, reports have provided sufficient photographic evidence that Kornet ATGMs were indeed both in possession of, and used by, Hezbollah in this area.
